

Westlake weekly air monitoring update (Friday 8/29/14).

Goal: Develop an air monitoring plan to sample for landfill constituents (COC's, RIM), in conjunction with the PRP, prior to and during the construction of the isolation barrier (IB) being built to contain the RIM in OU-1, that could be impacted by the SSE or landfill fire.

Data: VIPER communication issues the past week. ERT / START had stabilized system by 8/26/14. At this time, it appears that the system is operating normally.

Equipment: Two of the Gamma sensors on the AreaRaes were reporting false (higher than normal) gamma data. The probable cause is the hotter summer temperatures which heat up the internal probes and elements, causing the instruments to report higher gamma levels.

ECAM: Waiting for a final approval from RERT to add the ECAM check source to their special license. Chuck Hooper has drafted a letter to the NRC to instruct them to withdraw the Region 7 special license amendment.

QAPP: No issues related to the QAPP happened on site this week.

Media: No items of media interests were generated at this location this week.

Issues/concerns/comments: Construction was completed for a training facility roughly 30 feet from the Job Trailer location. This facility is designed for fire fighters to put out live fires. Additional construction is planned for the road that the Job Trailer is currently sitting. It is likely that the trailer will have to be moved. The Fire Chief and the Assistant Fire Chief are planning to meet with EPA next week.
